Turkish tractor manufacturer the Sanko Group has opted for MTA's dashboard for its latest agricultural machine.

As well as being mounted on the OEM's MST backhoe loader, the new Basak 5120 tractor will benefit from the human-machine interface panel.

A complete dashboard, the device features a 4.3" color TFT display, with several indicator lights as well as more traditional analog indicators. The built-in video input can be connected to a video camera that is installed on the tractor that also comes with a dedicated screen printing and a customized configuration of the dashboard and of the warning lights.

With proprietary software for customization of the display, Basak were able to tailor the device to their specific needs for the 5120 tractor.

Zafer Özbalaban, research and development director at Başak, said, "Revo Plus is very helpful in informing the operator about all the functions of the tractor through personalized symbols or warnings and it is especially appreciated that the visual of our tractor is displayed when switching on the cluster."
