

ENVIRONMENT POLICY

All human activities contribute in one way or another to the degeneration of our environment. There is a very real danger that natural resources, and hence human life itself, will disappear from our planet.

Neither is this an exaggeratedly apocalyptic vision. One only has to think of the many animal and vegetable species heading toward extinction in order to recognise that man is not immune from this danger. One recent essay on the subject puts it as follows: "The earth is being consumed: once its resources are finished, life on it will also finish".

But whether we like it or not, modern life is consumption oriented. If consumption stopped, so too would the economy that creates the resources for our way of living. Since we clearly don't want to return to being cavemen, we must try our best to curtail environmental damage while awaiting scientific discoveries which allow for modern production and consumption in the context of maximum environmental protection.

Let us therefore develop and improve our own pollution prevention plan by vigorously applying existing laws and by further committing ourselves to:

- Keeping in MTA an environmental management system in compliance with the ISO 14000;
- Involving all company sectors in this effort;
- Involving in this effort also all companies that work together with MTA
- Promoting training courses for management and staff;
- Monitoring results, especially as regards the reduction of energy, drinking water, discharges and packaging;
- Choosing recyclable materials for packing our products;
- Separating refuse items for disposal (plastic, glass, paper, etc.);
- Improving supervision of special refuse items;
- Monitoring air and water discharges and purifying the where necessary;
- Increasing plants and shrubbery in our green areas.

Dott. Ing. Umberto Falchetti

Chief Executive Officer

A handwritten signature in black ink, which appears to read 'Umberto Falchetti', is positioned below the printed name and title.
